GlobalConnect

Marketplace Chat with Multi-Language Translation

Nexconn Build Challenge 2026 - Detailed Build Plan

1. TECHNICAL ARCHITECTURE DECISION

Chat SDK Approach:

Use raw Nexconn Chat SDK (web) + custom React UI. No pre-built Chat UI for main app.
Reason: Your cards and flows are custom, and the challenge requires the Chat SDK.

Fallback Strategy:

If Day 1 check finds usable Nexconn web UI kit, use it for baseline (message list, input, image upload) and keep custom components for cards.

Backend Systems:

- Token endpoint: Handles authentication
- Signed webhook receiver: Prevents tampering
- Escrow ledger (sandbox): Payment status simulation
- AI service: Translation, moderation, mediator, summaries
- Database: Cases and notes storage

2. DAY 1 CHECKS (Critical Verifications)

- ■ Custom message types with JSON payloads for order context
- ■ Bot and agent joining existing channel seamlessly
- ■ Signed webhook verification with HMAC signatures
- ■ Nexconn native translation API (if exists, saves development time)
- ■ Rate limits for message sending and channel joins

3. FEATURE BUILD ORDER

Tier 1: Core Features (~5 days)

Essential for Demo Completeness (50% UX criteria)

1	Roles: Buyer / Seller / Agent	Your auth plus Nexconn user tokens
2	Order-linked private channel	SDK channel, one per deal
3	Pinned Order Context Card	Item, price, order ID, status - Custom message or UI header
4	Real-time 1-to-1 chat	SDK + typing/reading receipts + image evidence
5	Contact masking	Regex + LLM check, hide phone/email until deal completes
6	Deal Card: AI drafts terms	Custom card + AI, parties Accept/Counter
7	Milestone escrow cards	Fund/deliver/approve/release - sandbox money
8	Translation with original toggle	LLM or Nexconn native, binding terms in both languages

Tier 2: Differentiators (~3 days)

Judge Appeal: AI moderation, dispute resolution, trust metrics

9	Dispute button	Freezes funds, mediation mode
10	AI Mediator	Neutral timeline + outcomes, multi-language, 72-hr clock
11	Request Support: One-click	Agent joins same thread with history
12	AI dispute summary	Context packet for agent
13	Agent inbox	Cases needing attention, one-click join, mark Resolved
14	Owner metrics panel	Dispute rate, resolution time, leaks blocked, response time

Tier 3: Time Permitting (Polish)

- Agent-only private notes (backend only, not in channel)
- Shipping update cards (physical goods)
- Trust badge system
- AI scam-language flagging
- Large-font and voice-to-text mode

4. RISK ASSESSMENT & MITIGATION

HIGH RISK (Critical Path):

- Translation/Mediator service integration speed
- Escrow ledger webhook reliability

MEDIUM RISK:

- Contact masking accuracy (LLM false positives)
- Agent joining latency

LOW RISK:

- React UI components (well-scoped)
- Order context cards (simple UI)

5. KEY RECOMMENDATIONS

→ TEST Nexconn native translation TODAY - could save 2 days
→ Build dispute flow FIRST - judges love conflict resolution
→ Prepare 'fake but realistic' escrow demo with clear sandbox labels
→ Record 60-second Loom video of translation in action
→ Verify signed webhook format before implementing
→ Check message type JSON schema on Day 1

6. JUDGING CRITERIA ALIGNMENT

Completeness & UX (50%):

- ✓ Working core flow (buyer↔seller with order context)
- ✓ Clean, functional UI
- ✓ One 'Beyond Ordinary' feature visible

Innovation (30%):

- ✓ AI Mediator with multi-language support
- ✓ Dispute resolution as core workflow

Business Potential (20%):

- ✓ $23.5B market gap for marketplace trust systems
- ✓ SaaS model potential

Built with: Nexconn Chat SDK | React JS | Python Backend | NVIDIA AI
